an Alltech® company

TRIFORMANCE®

Textured Feed with High Levels of Antioxidants for Performance Horses

FEATURES

- Textured feed made with McCauley's performance horse feed supplement, **TRINERGY®**
- Especially designed for racing and performance horses. The stresses of training and competition (strenuous exercise, high exposure to air-borne irritants and pathogens, shipping, confinement, etc.) require unique nutritional support.
- Supplies high levels of specific vitamins and minerals whose normal functions include:
 - antioxidant activity
 - maintaining the integrity of muscles and lung tissue
 - production of connective tissue (maintains tendon strength and elasticity)
 - activation of the immune response
- Provides all additional minerals and vitamins required by horses
- Extremely palatable. The perfect solution for the "picky" eater.
- High fat content. Only vegetable oil added.
- High energy content

FEEDING INSTRUCTIONS

Feed ½ to 1¾ pounds of **TRIFORMANCE** per 100 pounds body weight per day, with good quality forage (hay and/or pasture) to maintain the desired body condition and energy level of the individual horse. The actual amounts required will depend on factors such as body weight, intensity and amount of work, season or climate and individual efficiency. The following table is offered as a guide:

Work Load	TRIFORMANCE™ lb/day	Hay/Pasture lb/day
Light	6	15
Moderate	10	15
Intense	16	10

- This Guideline is for horses with a mature body weight range of 1100-1300 lb (500-590 kg).
- The hay in this Guideline is an average quality mixed hay (12% crude protein & 0.85-0.90 Mcal/lb). As the hay quality drops, the amount of feed will need to be increased. Conversely, better quality hay can reduce the quantity of feed needed.
- Pasture means at the same moisture content and same nutritional quality as the hay.
- The amount of feed and forage in this Guideline is meant as a starting point. Individual horse needs will vary; therefore feeding should be adjusted per individual.

continued →

(FEEDING GUIDELINE CONT.)

- The range of feed required is wide. For "easy keepers" on excellent forage, the amount of feed may be halved. On the other hand, "hard keepers" on extremely poor forage may need double the amount of feed or must have better quality forage.
- The amount of feed given at any one time should be no more than 0.5% of the horse's body weight. For example, a 1200 lb horse should be fed no more than 6 lb per feeding and therefore, should be fed twice a day if at medium work and three times a day if at intense work.
- Always provide clean, fresh water.
- Salt should always be available.
- Additional electrolytes may be necessary if exercising at high intensity under hot and humid conditions.
- Do not feed additional proteins, vitamins or minerals except on the advice of a nutritionist.
- Consult your veterinarian concerning proper health programs, and always maintain a good worm control program.
